

Jagua Gel Instruction

The following will make approximately 45-50ml

5g Jagua Powder
25ml Water
1.5ml Essential Oil
1.5g Xanthan Gum

You should add more/less water/gum depending on the consistency you prefer.

Equipment Required

2 x non metallic bowls
Spatula
Mini scales
Pipette for essential oil
Piping bag to store the gel
Applicator (either bottle or cones)
Measuring jug that has measurements for small amounts of water
Gloves

Mixing Method

Take one of the mixing bowls and place onto the mini scales.
Weigh 4g of Jagua Powder into the bowl.
Measure 30ml of water (please note that you can have slightly less water but adding too much water will effectively dilute the stain colour that you get from the jaguar)
Add to the powder slowly to avoid any loss of the powder into the air.

In the other mixing bowl measure on mini scales 0.5g of Xanthan gum
(you can add slightly more if you prefer a thicker gel)

Using a pipette add the essential oil to the powder
(if you add too much oil it will make the jagua gel bleed on application and ruin any design)

Mix the Xanthan gum into the essential oil until all has been absorbed.

Mix slowly the jagua liquid into the xanthan gum mix and then mix thoroughly using a spatula.
You can also use a mixer.

Your gel is now ready. Remove the gel into the piping bag to enable you to fill your applicator easily without loss of any gel. If you find this recipe is too thick or thin for your requirements you can add or minus water.

Application Tips

Apply to clean dry skin. Avoid areas prone to sweat as this will spread the dye. Leave to dry and leave on the skin for at least 1 hour. When removed Jagua the colour will be very light. This develops over 24-48hrs. Before sleeping wash the area to remove any excess dye that is still present on the skin which could spread to bed sheets.

Keep frozen for freshness.

Allergies
